

4.4. Numeric Types — `int`, `float`, `complex`

Operation	Result
<code>x + y</code>	sum of <code>x</code> and <code>y</code>
<code>x - y</code>	difference of <code>x</code> and <code>y</code>
<code>x * y</code>	product of <code>x</code> and <code>y</code>
<code>x / y</code>	quotient of <code>x</code> and <code>y</code>
<code>x // y</code>	floored quotient of <code>x</code> and <code>y</code>
<code>x % y</code>	remainder of <code>x / y</code>
<code>-x</code>	<code>x</code> negated
<code>+x</code>	<code>x</code> unchanged
<code>abs(x)</code>	absolute value or magnitude of <code>x</code>
<code>int(x)</code>	<code>x</code> converted to integer
<code>float(x)</code>	<code>x</code> converted to floating point
<code>divmod(x, y)</code>	the pair <code>(x // y, x % y)</code>
<code>pow(x, y)</code>	<code>x</code> to the power <code>y</code>
<code>x ** y</code>	<code>x</code> to the power <code>y</code>
<code>complex(re, im)</code>	a complex number with real part <i>re</i> , imaginary part <i>im</i> . <i>im</i> defaults to zero.
<code>c.conjugate()</code>	conjugate of the complex number <i>c</i>

Operation	Result	Notes
<code>math.trunc(x)</code>	<code>x</code> truncated to Integral	
<code>round(x[, n])</code>	<code>x</code> rounded to <code>n</code> digits, rounding half to even. If <code>n</code> is omitted, it defaults to 0.	
<code>math.floor(x)</code>	the greatest integral float <code><= x</code>	
<code>math.ceil(x)</code>	the least integral float <code>>= x</code>	

4.4.1. Bitwise Operations on Integer Types

Operation	Result	Notes
<code>x y</code>	bitwise <i>or</i> of <code>x</code> and <code>y</code>	
<code>x ^ y</code>	bitwise <i>exclusive or</i> of <code>x</code> and <code>y</code>	
<code>x & y</code>	bitwise <i>and</i> of <code>x</code> and <code>y</code>	
<code>x << n</code>	<code>x</code> shifted left by <i>n</i> bits	(1)(2)
<code>x >> n</code>	<code>x</code> shifted right by <i>n</i> bits	(1)(3)
<code>~x</code>	the bits of <code>x</code> inverted	

4.6. Sequence Types — `list`, `tuple`, `range`
